

How do I enable URL Rewrite in Horizon QCMS 4.1?

This applies only to Horizon QCMS 4.1

Please keep in mind that the URL_Rewrite function in Horizon QCMS 4.1 is only tested on an Apache webserver (on MS-Windows and Linux servers).

Step 1

Open config.php in Notepad and look for the \$url_rewrite variable.

```
# Extra configuration options
# To enable URL rewrite, set $url_rewrite=true;
#
# Please, keep in mind that the url_rewrite function is
# only tested on Apache webserver on Linux and MS-
# Windows computers.

$url_rewrite=false;
#$url_rewrite=true;
```

Step 2

Change \$url_rewrite into true: `$url_rewrite=true;`

```
# Extra configuration options
# To enable URL rewrite, set $url_rewrite=true;
#
# Please, keep in mind that the url_rewrite function is
# only tested on Apache webserver on Linux and MS-
# Windows computers.

#$url_rewrite=false;
$url_rewrite=true;
```

Step 3

Save config.php and then you'll have enabled URL_Rewrite!
